Load/Life Calculations	13

What's Inside

3, 4 or 5-wheel carriage* assemblies with the guide wheels mounted in-line roll along (and are captured within) the channel guide rail. For the 3 and 4-wheel carriage assemblies, the two outside guide wheels are concentric, while the centre wheels are eccentric. The 5-wheel carriage assemblies feature concentric centre wheel and outer wheels with eccentric second and fourth wheels.

Carriage assemblies are pre-set at the factory, but are easily field adjusted by rotating the eccentrically mounted centre guide wheels. This allows modification of running characteristics such as drag, breakaway force and preload.

Each wheel carriage assembly includes a standard lubricator, which distributes a light coat of oil along the length of the channel during normal operation. Lubrication of the channel increases life and speed capacity.

*PW Series polymer and CR Series stainless steel composite wheel carriage assemblies available in 3-wheel configuration only.

Introducing UtiliTrak® Linear Guides

The UtiliTrak® linear guide system from Bishop-Wisecarver is designed for applications where low cost, easy installation and minimal maintenance requirements are the primary design objectives. Constructed with DualVee Motion Technology®, UtiliTrak® offers high reliability, easy installation and low maintenance in a sleek, compact design.

Designed primarily for transport type applications, UtiliTrak® is intended for use where load capacity, stiffness, and positional accuracy are less demanding than machine tool grade applications. UtiliTrak® offers a low cost alternative to recirculating ball guide technologies, which often require a considerable amount of surface preparation, adding significantly to the total installed cost.

UtiliTrak® can be specified in three basic formats:

- **SW** – Hardened and ground steel channel with precision steel wheels.
- **PW** – Aluminium alloy channel with polymer overmoulded wheels.
- **CR** – Stainless steel track mounted to aluminium channel with stainless steel wheels.

See page 2 for full specification

Open/Guided Mounting Configuration

Open Channel

Vee Channel

Features and benefits

- Antifriction operation
- Low noise
- Smooth running
- High speed capacity
- Unlimited travel lengths
- High load capacity
- Resistant to contamination

Product Comparison and Overview

Features	SW Series UtiliTrak®	PW Series UtiliTrak®	CR Series Stainless Steel Composite UtiliTrak®
Channel/Channel Assembly	One-piece ground carbon bearing steel channel, running surface smooth to Ra 0.8µm, hardened steel raceways, RoHS compliant anti-corrosion plated.	6063 – T6 aluminium alloy channel	Induction heat treated 420 stainless steel DualVee® track mounted to an extruded aluminum channel
Studded DualVee® Guide Wheels	52100 carbon steel, ground, double row, angular contact bearing arrangement, available sealed or shielded, internal lubrication	High temp polymer overmoulded on a stainless steel bearing arrangement, built-in wiper caps at each end clear debris from the channel surface	440C stainless steel, double row, angular contact bearing arrangement, sealed
MadeWell™ Crown Rollers	52100 carbon steel, ground, double row, angular contact bearing arrangement, available sealed or shielded, internal lubrication	High temp polymer overmoulded on a stainless steel single row deep groove bearing, built-in wiper caps at each end clear debris from the channel surface	
Wheel Sizes	1, 2 and 3	0, 1 and 2	1, 2 and 3
Wheel Carriage Assembly	3, 4 or 5-wheel configuration	3-wheel configuration only	3-wheel configuration only
Lubricator & Wiper Assembly	Nylon end cap with felt lubricator, one lubricator assembly on each end, synthetic oil	Nylon end cap with felt lubricator, one lubricator assembly on each end, synthetic oil	Stainless steel stamped felt lubricator with synthetic oil, centrally located lubricator
Load Capacity	Up to 14,040N	Up to 311N	Up to 5,739N
Speeds	Up to 5.5 m/s	Up to 1.0 m/s	Up to 5.5 m/s
Acceleration	Up to 49 m/s ²	Up to 29 m/s ²	Up to 49 m/s ²
Key Benefits	High speeds, excellent load capacity, smooth antifriction operation, debris tolerant	Lowest installed cost in its class, corrosion resistant, low noise, lightweight, wear resistant	High speeds, excellent load capacity, smooth antifriction operation, debris tolerant, corrosion resistant

Wheel Carriage and Vee Channel Assembly

MadeWell™ Crown Roller & Open Channel Assembly

CR Series Stainless Steel Composite Assembly

PW/SW Series 3-Wheel Carriage Assemblies

PW Series

- Vee style carriage assembly for PW Series aluminum channel
- Light to medium duty transport applications
- Extremely low noise
- Lightweight and economical

SW Series

- Vee style carriage assembly for SW Series steel channel
- Medium to heavy duty transport applications
- High speed capability
- Smooth antifriction operation

Weights

UtiliTrak® Size	Channel Weight (kg/m)	Wheel Carriage Weight (g)	Channel Weight (kg/m)	Wheel Carriage Weight (g)
	PW Series		SW Series	
0	0.3	46	-	-
1	0.5	92	1.46	114
2	0.93	243	2.7	330
3	-	-	5.91	943

To Calculate M:

Step 1: Calculate number of hole spaces

$$\frac{\text{Length (in mm)} - X}{80} = \# \text{ of hole spaces (round down to nearest whole number)}$$

$$X = 14 \text{ (size 0)}$$

$$X = 16 \text{ (size 1)}$$

$$X = 18 \text{ (size 2)}$$

$$X = 20 \text{ (size 3)}$$

Step 2: Calculate M

$$\frac{\text{Length} - (\# \text{ of spaces} \times 80)}{2} = M \quad (\text{Note 4})$$

Notes:

1. "L" is maximum one piece length.
2. For ordering add length in mm after Part Number Ex. UTTA0-1000 (one metre length).
3. Overall length +/- 2 mm.
4. Customer to advise 'M' dimensions when ordering, otherwise end hole position will be equal at both ends.

PW/SW Series Crown Roller 3-Wheel Carriage Assemblies

PW Series

- Crown roller style carriage assembly for PW Series aluminum channel
- Intended for radial loads only
- Extremely low noise
- Lightweight and economical

SW Series

- Crown roller style carriage assembly for SW Series steel channel
- Intended for radial loads only
- High speed capability
- Smooth antifriction operation

UtiliTrak® Size	Channel Weight (kg/m)	Carriage Weight (g)
1	1.457	136
2	2.591	385
3	4.884	1107

Notes:

1. Contact HepcoMotion for quotation on non-standard channel lengths.
2. "length" equals channel length in mm in the middle of the UT channel Part Number.
3. Channel length tolerance is ± 2 mm.
4. Customer to advise 'M' dimensions when ordering, otherwise end hole position will be equal at both ends.

System Adjustment & Mounting Details

System Adjustment

Carriage adjustment is pre-set at the factory, but is easily field adjusted by rotating the eccentric guide wheels. This allows modification of running characteristics such as friction and breakaway force.

1. Adjustment should be performed while the carriage is engaged with the channel.
2. Looking down on the top of the carriage, as shown in Fig. 1, the eccentric stud is locked into place with a hex nut.

3. Loosen the eccentric wheel/stud assembly by turning the hex nut counter-clockwise with a socket wrench.
4. When the wheel/stud assembly is loose enough, it can be rotated with a wrench, as shown in Fig. 2. Rotating the eccentric wheel's stud will adjust the wheel location into or out of mesh with the channel.

5. Begin with a small adjustment to the setting and re-tighten the stud by turning the hex nut clockwise. If the setting is too loose, the carriage will exhibit excessive play, such as rocking. If the setting is too tight, the carriage will exhibit excessive friction. Move the carriage up and down the entire channel length to ensure that it does not feel too loose or tight at any given location along the channel. It may take a couple of attempts to find the proper setting for your system. Take care not to over preload PW Series polymer wheel carriages. It is important that the carriage setting is correctly adjusted prior to operation.

Mounting Details

The UtiliTrak® Vee guide assembly can be employed to accept loads in all orientations. However, it is primarily intended to support loads in the radial plane (F_R). As such, it is good engineering practice to orient the slide such that the two outside wheels support the load radially. Each carriage assembly includes an arrow pointing towards the optimal direction of load orientation. Loads oriented in this direction will produce a radial load on each of the concentrically mounted (outer) guide wheels.

The crown roller assembly should be subjected to radial loads only.

Close-up of UtiliTrak® carriage. Arrow indicates optimal direction of load orientation.

Technical Data

Load Capacity

The load capacity ratings in this guide are based on 100km (4 million inches) of service life. As with any linear bearing technology, UtiliTrak® sizing should be done conservatively. If the guide selection is such that load capacities are marginal, it may be appropriate to consider the next larger size. Our applications engineers are available to assist with the evaluation of any application specific loading parameters.

Lubrication

The recirculating elements within DualVee® guide wheels are permanently lubricated and sealed against the operating environment. The contact surfaces between the wheel and channel, however, require lubrication to maximize the life and speed capacity of the guide. All UtiliTrak® carriages come complete with lubricators, consisting of an oil saturated felt within a housing. Lubricators should be periodically checked and re-oiled to ensure that a sufficient coating of lubricant is maintained on the channel guideway surfaces.

Accuracy

The precision of UtiliTrak® is defined differently than typical recirculating ball guides. These are designed primarily for “high end” positioning applications, such as machine tool guideways, Cartesian coordinate robotics and precision XY inspection equipment. These guides are more rigidly defined in terms of the running parallelism of carriages to rail, and are measured as a function of rail length. Their higher cost can be attributed to the grinding and finishing operations necessary to achieve these tight tolerances.

UtiliTrak®, in contrast, has been developed for “lower end” transport applications. The definition of accuracy in this class of guide is independent of channel length, and is measured solely by the parallelism maintained between the critical channel surfaces, which does not vary by more than 0.05 mm (.002”) over the entire length of the channel.

As with any linear guide, installed accuracy is directly related to the straightness and flatness of the surface to which it is mounted. Because the guide will conform to the mounting surface, it is important for that surface to be more rigid than the UtiliTrak® channel.

Load/Life Calculations

The summation of applied loads divided by system load capacities (Max) should be less than or equal to one:

$$L_F = \frac{F_R}{F_{R(MAX)}} + \frac{F_A}{F_{A(MAX)}} + \frac{M_R}{M_{R(MAX)}} + \frac{M_Y}{M_{Y(MAX)}} + \frac{M_P}{M_{P(MAX)}} \leq 1$$

The applied force on the system is equivalent to:

$$F = F_{R(MAX)} * L_F$$

With an equivalent applied load, the system life can now be calculated:

$$L_{km} = 100 * \left(\frac{C}{F} * \frac{1}{f_c} \right)^3$$

L_{km} = System life in kilometres
 C = System Dynamic Load Rating
 F = Equivalent Load
 f_c = Correction Factor

Correction Factor Table

Environmental Factor	Correction Value f_c
No Shock, No Vibration, Clean Working Environment, Below 1 metre/sec	1.46
Light Shock, Light Vibration, Between 1 metre/sec to 2 metres/sec	1.85
Shocks, Vibrations, Harsh Environment, Above 2 metres/sec	3
